Hello,

I need to setup backup solution. The fastest way is to just rsync update files to backup server. But the problem is, that I need to reinitialize quota when trying to start container using just rsynced files from running HN. Reinitializing quota takes a lot of time. Is it possible to turn off quota while starting container, and then turn it on, on new running container.

vzdump isn't the solution, cause it takes a lot of time to dump and then to transfer files to backup server. Maybe there is any solution to run dump only changed files to already existing tar?
