Subject: Crash After Live Migration - DFS1339: Retrying delayed mount in 16 seconds

Hello,

We've experienced this same behavior yesterday and today (on different hardwares). I am not sure but I believe we were migrating the same VE (yesterday from ServerX to ServerY and today from ServerY to ServerZ).

After doing a live migration of a container we saw on dmesg:

DFS1339: resuming daemon started
DFS1339: Retrying delayed mount in 16 seconds
DFS1339: Retrying delayed mount in 32 seconds

Not sure if this was related, but I tried to restart this container as soon as I saw these messages and the hardware crashed while I was seeing:

"vzctl restart 1339
Restarting container
Stopping container ...
"

I believe we got a kernel panic since it rebooted itself (we have panic=10) and server got back few minutes later.

Any hints?
