---

Hi at all!

I've followed the bind mount guide with openvz, so I've mounted the /var/www on two containers to share the content (web site: php files and so on)

I'll try to mount in the host two files of 3 Gbyte with a loop device and format them with ext3 fs, and mount the loops in a folder /var/www/site1 and /var/www/site2 on the host I'll see all the file mounted and I'll enter in the folder.

the mount output on the host:

```
/var/lib/vz/www-images/site1.ext3 on /var/lib/vz/www/site1 type ext3 (rw,loop=/dev/loop1)
/var/lib/vz/www-images/site2.ext3 on /var/lib/vz/www/site2 type ext3 (rw,loop=/dev/loop2)
```

(the /var/lib/vz/www is mounted on the two containers in /var/www)

but when I enter in the container I didn't see the mount, so I see the bind but not the loop mounted in the folder site1 and site2... so is possible to make accessible the loops mounted in that folder to the containers?

how can I do that?

Best Regards

Franco
