Subject: How to turn on kernel messages in VPS?

Hi!

There is no output from dmesg in VPS. Is it possible to turn it on? (Regular printk-related sysctl variables seem to be ok). In particular, I want to see oom-killer and segfault messages (thttpd dies for some unknown reason in my VPS =( )

My kernel is from debian lenny - 2.6.26-2-openvz-686.
vzctl version is 3.0.22
