Hi all

I have  a container with Ubuntu 11.04

Not starting NFS kernel daemon: no support in current kernel (Linux 2.6.32-4-pve)

I have load the module nfs in host and adding this to container:

```
# vzctl set 101 --features "nfs:on" --save
# vzctl start 101
```

But when I try to restart nfs-server i get:

```
/etc$ sudo /etc/init.d/nfs-kernel-server restart
 * Stopping NFS kernel daemon
                [ OK ]
 * Unexporting directories for NFS kernel daemon...
                     [ OK ]
 * Not starting NFS kernel daemon: no support in current kernel.
```

What is the problem??

Thanks
