Subject: VLANs

Hello OpenVZ community,

I have a question, i problems setting up openvz the way i want.
The openvz machine only receives 802.1q tags from the uplink switch.

What i want to accomplish is:
1. "hardware node / special purpose containers" in vlan 10 - works
2. "container" in vlan 20

Both subnets have other external IPs as well.

I've created the vlan interfaces (vconfig add eth0 10 & vconfig add eth0 20), ifcfg-eth0.10. ifcfg-eth0.20 doesnt cause the hardware node will not have an IP in this subnet.

What i need to accomplish is, get a container working with passing the vlan tag to it. So the container itsself doesn't need to be vlan aware or able to change its vlans.

Anybody out there whom knows how to proceed with this setup?

Thanks!
