Subject: Question About Debian Squeeze OVZ Kernel

Hi All,

I'm in the lab testing debian squeeze and OVZ. The current debian repository is listing this for the OVZ kernel:

root@ovz-test:~# aptitude show linux-image-2.6.32-5-openvz-686
Package: linux-image-2.6.32-5-openvz-686
State: installed
Automatically installed: yes
Version: 2.6.32-38
Priority: optional
Section: kernel
Maintainer: Debian Kernel Team <debian-kernel@lists.debian.org>
Uncompressed Size: 80.6 M

How does the debian kernel version 2.6.32-*[38]* coorespond to the official OVZ release cycle kernels, the current stable release being (vzkernel-2.6.32-042stab040.1.src.rpm )?

Does this indicate the debian kernel is 4 stable releases behind? Is anyone using the squeeze repository OVZ kernel? Any feedback on stability or use would be appriciated.

Thanks.

JR
