Hello;
We had installed Openvz step by step from;
wiki.openvz.org/Quick_installation

When we came to "Rebooting into OpenVZ kernel" side at the page, we understood that Openvz write own kernel on the Centos kernel so after restart start openvz kernel.
On the centos we have more important applications and it must be work everytime. So we must uninstall openvz from centos correctly for it.

Our kernel is that wiki.openvz.org/Download/kernel/rhel5/028stab095.1 we download and install.

How we can uninstall completely? Like at the starting i said that, we countiune install step by step by wiki.openvz.org/Quick_installation guide to "Rebooting into OpenVZ kernel" side.

the last question is;

After we sucessfully uninstalled Openvz, Centos and the applications on the server are work correctly?

Thank you for your helping.
