I said cpulimit, not cpuunits

in your config you are setting limit 90

please take a note, that to calculate cpulimit you have to sum all cores which you give for CT
so if you have 8 cores cpu all power is 800%

$8\text{cores} * 100\% = 800$

if you want that CT don't use more than 50% of cpu you have to set it to 400

with limit 90 you set ~10% of cpu power.

if you set for CT 2 cores (--cpus X)

than to calculate limits you need to sum: $2\text{cores} * 100\% = 200\%$

with limit 90 it would be little bit less than 50%
