thanks

Hi

I have got the following bugreport. What can you say about it?

Regards,

// Ola

----- Forwarded message from Andrew Schulman <andrex@alumni.utexas.net> -----

Package: vzctl
Version: 3.0.10-1
Severity: important

With a fresh installation of vzctl, I get

# /etc/init.d/vz start
Starting OpenVZ: ..failed

and this prevents the package from installing completely, by the way.
There are two problems:

(1) The script fails because '/sbin/modprobe vzdquota' fails in the
'for MOD in $MODULES' loop beginning at line 378. But that's only
because I don't have a vzdquota module for my kernel, so it shouldn't
be an error. (I can't find any vzdquota-related kernel config option,
probably because I don't have user accounting enabled in general in my
kernel. But even if I did have it it could be built into my kernel,
not as a module.) It seems that the script should check that a module
exists before trying to load it.

(2) The script doesn't tell me why it failed. It calls

print_failure "Loading module ${MOD}"

which should print that information to the console, but doesn't.

Thanks,
Andrew.

-- System Information:
Debian Release: testing/unstable
  APT prefers testing
  APT policy: (990, 'testing'), (300, 'unstable'), (200, 'stable')
Architecture: amd64 (x86_64)
Shell: /bin/sh linked to /bin/bash
Kernel: Linux 2.6.16
Locale: LANG=C, LC_CTYPE=C (charmap=ANSI_X3.4-1968)

Versions of packages vzctl depends on:
ii libc6 2.3.6-15 GNU C Library: Shared libraries

vzctl recommends no packages.

-- no debconf information
