here's a "poor mans vzps" in bash:

```
#!/bin/bash
```

```
PIDLIST=(`ps ax | grep -v PID | awk '{print $1}'`)
```

```
findpids(){
```

```
veidesired=$1
```

```
pidlist=
```

```
for i in `seq 0 ${#PIDLIST[*]}`; do
```

```
    pid=${PIDLIST[$i]}
```

```
    [ -f /proc/$pid/status ] || return
```

```
    veid=`grep envID /proc/$pid/status | awk -F: '{print $2}'`
```

```
    if [ ${veid} = ${veidesired} ]; then
```

```
        pidlist=$(echo $pidlist $pid)
```

```
    fi
```

```
done
```

```
}
```

```
findpids $2
```

```
if [ "${pidlist}" ]; then
```

```
    ps $1 -p "$pidlist"
```

```
fi
```

```
exit 0
```

takes 'ps' arguments and VE ID as a second one, example:

```
./ovzps fw 10000
```
