Subject: new linux user would like to try openvz a few questions

before I screw up my laptop I figure it would be best to ask a few questions here. I have a netbook (toshiba n350 2gb ram) and I would like to learn linux using this. I installed an offshoot of fedora (kororaa) and would like to learn in a virtualized environment off this laptop. As kvm will not run and other virtualizations look heavy I would like to give this a shot.

Since Kororaa is basically fedora 16 with some stuff added to it, I am assuming anything I would ask about fedora 16 would apply to kororaa.

1) Are there any known issues running this software on fedora 16?
2) is it an issue using the openvz kernel? From what I read it is actually a rhel 2.6 something kernel. Will this work without breaking the programs I have on Kororaa?

Thanks for listening, again I am truely new to this so I hope I am not asking silly questions here...
