Subject: running openvz inside virtualbox

Hello,

we are using a CentOS 5 installation with openvz to run some virtual machines. At the moment we set up a backup system to store our virtual machines on a storage and if something fails we can transfer the virtual machines back to another host. We will not test the backup and restore procedure on our productive system so the idea was to use virtualbox (on a desktop pc) an install centos inside and then using there openvz.

Windows 7 (64-bit)
-> Virtualbox
-> CentOS
-> openvz
-> our applications

Unfortunately after installing the the openvz kernel I get an kernel panic.

openvz kernel: 2.6.32-042stab049.6

Is it possible to use openvz inside virtualbox?
I also tried some boot parameters but without luck.

Thanks

Regards Markus
