Hi,

Our hardware node is crashing quite frequently, about 4 times in 7 days and I am forced to restart the node every time.

From the logs I can see this same error always.:

```
 ============================================================ ===
Sep 30 00:11:11 kraken kernel: list_add corruption. prev->next should be ffff81081bdd9218, but was ffff8107b784d0e0
Sep 30 00:11:11 kraken kernel: --------- [cut here ] ------- [please bite here ] -------
 ============================================================ ====
```

Our server runs in CentOS 5.8.

The Opven VZ kerenel version is 2.6.18-308.8.2.el5.028stab101.1

The server has 64GB RAM. We have replaced the RAM thinking that it was due toa faulty memory module, but still the issue is persisting.

Every-time I am getting the same error in var/log/messages.

Can anyone help me with this ?
