Hi,

[duplicate message, please refer message #48783]

I have install 2.6.32-042stab062.2 in several servers. Each server running around 40 VPS which include CentOS 4 (32 bit), CentOS 5 (both 32 and 64 bit) and CentOS 6 (64 bit). For those servers running on Dell R410, the host CPU and Memory usage is fine. However for those servers running on HP DL360p G8, it is observed that the host CPU system time is keep growing. It also observed that the CPU will drop if the snmpd and autofs daemon in the VPS is restarted therefore a script is wrote to restart all VPS snmpd and autofs daemon daily as a work around solution. Anyone has similar problem? Thank you.

Regards,
Kelvin
