Subject: Weird Network Setup - help please?

Hi,

One one of my nodes, the IPs have to be attached to a VPS for several hours, and once it keeps trying to make connections outside - it is only then added to the router's ARP

However, when we remove the IPs from the VPS's and wait for some hours, and then try to reattach them - again they just die and require us to keep them on a VPS for sometime to get them to regain connection.

if this is an ARP problem, isn't there a way to keep the IP active? somehow? Even if it isn't used by a VPS?

Please tell me if you have any solutions.

Thanks.
