Ok so I read alot and refreshed my emmory on hwo this works
I bought a dedicated server at a reputable data center
I installed openvz no problem
I create the first vm command line so have a container to run a SoluVM panel
Now my problem
I cant connect to the vm no mater what do
I put in ticket to dc support and they tell me I have to add the MAC address of the vm from interface in my server panel for the switch to allow traffic
As venet doent assign a MAC Im unsure what to do now
I did this about 8 years ago and had no such problems and I red about using veth instead but that its also more insecure so any help now would be appreciated
