Subject: Get the bandwidth limit of a container from within it?

I have designed a script to monitor multiple openvz containers and report data to a central server for monitoring purpose. As a part of it, I am using the data from /proc/net/dev to report the bandwidth already used. To report data of usage as a percent, I need to get the total alloted bandwidth limit of a container from within it. Is there a way to get this data?

Currently I use the data inbound from:

grep venet0 /proc/net/dev | cut -f2 -d: | awk '{printf"%s",$1}'
