Subject: Multiple mountpoint below guest CT (ZFS probably others)

I'm trying to use ZFS to provide a flexible support to guest CTs.

The root of the CT is a ZFS volume mounted to "<CID>/private" which VZ mounts to "<CID>/root". This works ok.

However, another ZFS volume is mounted below, let's say "<CID>/private/mnt/second". Within the VZ mount, "<CID>/root/mnt/second" is in fact an empty folder for the mountpoint.

I'm currently solving that by mounting the second volume *after* the CT is started, but that means I have to manually start the services inside the CT after that.

I'd like cleaner solution.

Any idea?

TIA

greg
