Hi!

I've got a problem with running Fuse on container with Debian 7 x64.

First I read [openvz.org/FUSE](#) and asked my VPS provider to enable Fuse, he did it and I got fuse in /dev/ but it still doesn't work.

I asked my provider for a help but he told me that this is how it looks in this virtualization and fuse will not work.

Please, tell me if is it true and what can be wrong?

I tried to run fuse on debian7 x64 and x86, fedora 19 x64 and debian6 x64.

I tried also compile fuse from source.

Below I show my steps on fresh debian7 x64:

```
root@vps:~# apt-get update
root@vps:~# apt-get upgrade
root@vps:~# apt-get install libfuse2 fuse curlftpfs
root@vps:~# reboot
root@vps:~# curlftpfs -o user=login:pass ftp.server.com /mnt
fuse: device not found, try 'modprobe fuse' first
root@vps:~# modprobe fuse
libkmod: ERROR ../libkmod/libkmod.c:505 kmod_lookup_alias_from_builtin_file: could not open
builtin file '/lib/modules/2.6.32-042stab083.2/modules.builtin.bin'
FATAL: Module fuse not found.
root@vps:~# ls -la /lib/modules/2.6.32-042stab083.2/
