Subject: Q: hardcoded parameters and restrictions

Hi,

vzctl contains a few hardcoded parameters and restrictions which need to be converted into configurable vps.conf parameters.
In particular, I mean HOME and PATH environment variables, allowed fs types (e.g. sysfs) - all these parameters should be easy to implement.

kernel space also contains hardcoded stuff.
There is a flag to enable/disable sysfs within container, but I found no normal way to disable /proc.
Also, it seems to be no way to disable devices listed in default_minor_perms.
Set of files added to virtualized /proc is also hardcoded, I found no way to e.g. add /proc/devices file required for some third party software.
