Subject: OpenVZ Inside Access

Hello,

At the moment is openvz configured, with firewall rules allowed on the containers/vms. (csf)
It is configured.

The problem:
- Block port 80 with csf
- Still get access from another container with a different public IP to it.
So if i connect to another vms (same hn) it looks like the firewall rules are not applied and the machines can connect with each other with the rules enabled. For the outside world, the rules are fine.

What can i do to block access from container to container with the firewall on the vms, it is pretty weird this is possible by default?

Thanks.
