Subject: second level quota problems with 2.6.32-042stab113.11

trouble started with cpanel showing other files disk usage

I updated to kernel 2.6.32-042stab113.11 from 2.6.32-042stab112.15

then dropped quota file with "vzquota drop xxx" and reinitialized the quotas for the CT.

after this, the disk usage was reported as less than actual(weird), cpanel /scritps/fixquotas reported errors "no filesystem with quotas"

on cpanel support suggestion I booted into an earlier kernel, I choose 2.6.32-042stab111.12, and quotas seem all ok

did not try to reboot into currect kernel as this is a live sistem and no place to experiment but cpanel support mentioned other users also having quota issues with latest kernel

could this be looked into?
