Hi,

We run openvz6 on our nodes and we have also seen an important performance impact as explained here: https://forum.openvz.org/index.php?t=tree&goto=53129&S=e69f527aaf3966212d966f6e92e8180f#msg_53129

I suppose it's all quite related, independent of which exact OS used.

Disabling the problematic software in this case (clamav) has stabilized things on that particular node but I understand that this is only a workaround. But we can't really think of anything else if we want to be protected..

Regards!
