Subject: No arp entry on vlan interface

When I upgrade from openv 7.0.6 to 7.0.6, I was unable to communicate from container to outside.
I use vlan interface on HN :
em1 -- br0 -- vlan18

On previous releases, arp entry are created on any interfaces. Now, the arp entry is added only on virbr0 interface:

```
apr -en
Address              HWtype  HWaddress          Flags Mask          Iface
....
192.168.18.239         *     <from_interface>   MP                  virbr0
192.168.18.239         *     <from_interface>   MP                  vlan18
...
```

And now

```
apr -en
Address              HWtype  HWaddress          Flags Mask          Iface
....
192.168.18.239         *     <from_interface>   MP                  virbr0
...
```

I found the filter on /usr/libexec/libvzctl/scripts/vz-functions line 642 (function vzgetnetdev) :
Quote: [-e "/sys/class/net/$dev/device" -o -e "/sys/class/net/$dev/bridge"] || continue

Can you change this line to enable vlan interfaces ?
