Hello, we have updated all the servers that we have to the new version of CentOs (CentOS Linux release 7.5.1804), by doing so, all the servers have run out of RED and are inaccessible.

As a virtualization we use OpenVZ7 and Proxmox 3.4 and in the 2 it happens exactly the same.

Is there any way to fix it?

NOTE: We have also done a test of assembling a machine with Centos7 and when updating it to 7.5 it happens exactly the same.

Thanks!
