---

Sorry, the problem shall be resolved.

It was caused by ext4lazyinit.  
[https://www.thomas-krenn.com/en/wiki/Ext4\\_Fileystem](https://www.thomas-krenn.com/en/wiki/Ext4_Fileystem)

If I use -  
mkfs.ext4 -E lazy\_itable\_init=0,lazy\_journal\_init=0 /dev/xxx/yyy  
Then wait for mkfs.ext4 some time (a few minutes).  
Not sure why ext4lazyinit runs over a hour, but still running...

Then, the mdadm rebuild performance looks normal even the /vz filesystem is mounted.
