Thank you very much, i confirm that this method described works perfectly and you get full working virtuozzo after conversion. So i guess vzdeploy could be changed to reflect those workarounds i guess, or put this workaround into documentation in the meantime, great work, have a nice day, this will be very handy for converting new CentOS 7 machines into OpenVZ... much easier then ordering KVM switch to do custom .iso install

PS. The problem was definitely in old vzkernel in vzdeploy, and i did always restart it and then loose network to be able to update it.
