Subject: Installing CentOS 7 packages on OpenVZ 7

I'm migrating to OpenVZ 7 from CentOS 6 with vzkernel and building out a new server.
I want to install base packages of nagios, nrpe, bacula and a few others that are standard centos 6/7 packages. How can I install them?

I see in /etc/redhat-release it shows:

Virtuozzo Linux release 7.8

So does that mean that it's based on CentOS 7.8?
Can I muck with the repos and spoof CentOS 7.8?
Are there any repos that have some basic monitoring/backup support specifically for OpenVZ?

Thanks!
