I'm migrating from OpenVZ 6 to OpenVZ 7 using the recommended script (ovztransfer.sh) however I'm getting the following error when trying to start the node on the new host:

```
# vzctl start 201 --wait
Starting Container ...
Mount image: /vz/private/201/root.hdd
Container is mounted
Setting permissions for image=/vz/private/201/root.hdd
Running quotacheck ...
quotacheck: Unknown quota format: vfsv1
Supported formats are:
  vfsold - original quota format
  vfsv0 - new quota format
  rpc - use RPC calls
  xfs - XFS quota format
Unmount image: /vz/private/201/root.hdd (190)
Container is unmounted
Failed to start the Container
```

The error message suggests that there is an issue with the quota settings in the container's root filesystem. The specific error "quotacheck: Unknown quota format: vfsv1" indicates that the system is trying to use the "vfsv1" quota format, which is not supported.

I imagine I want to set vfsold somehow, but it's not clear how/where this is achieved.
