Thanks for the instructions.

After installing new kernel with veth support veth devices are running now. So far I can see the speed is the same as HW now.

But due to veth there are some new questions now:

1. I add veth and eth0 device to bridge in HW node. I had to set a route to IP of VPS to veth device, otherwise I couldn't reach the VPS. Is this correct? I thought there is no routing necessary bcs. of the bridge.
2. How can I automatically assign IP to eth0 device in VPS? If i use /etc/network/interfaces the file is empty after restarting VPS.
3. After restarting the VPS the veth dev in HW was down. I had to do the whole procedure (adding to bridge ...) manually again. Is it possible to do this automatically?

Thanks.
