hi,

i used the standard debian 3.1 template, as downloaded from openvz.org; the vps contains "halt".

what happens is that i execute `vzctl stop XX`, and `vzctl` timeouts. it does kill most of the processes (just leaving 3 running, other times it kills all of them). for example, `vzlist` shows:

```
17      0 running      vsrv17
```

the `--fast` option didn't help either
