Is there a list of all possible parameter names for the VEID.conf and the dist/distname.conf files somewhere, btw?

man vps.conf gives the list.

Great!

It does fail to mention the possibility to use \$VEID though.

This made me wonder: how wold you formulate a generic VETH= line, where some bytes of the MAC address are VEID-derived thus unique?

(so I can just use the same VEID.conf file for all my otherwise identical VEs.)
