Well, I suppose the logic of man developers was something like that:

OK, OK, since then I realised I can't even write
VETH="veth\$VEID.0 ... "

Quote:

As concerns

Quote:

This made me wonder: how would you formulate a generic VETH= line, where some bytes of the MAC address are VEID-derived thus unique?

Sorry. I don't understand you quite. AFAIK MAC address for veth device can be set by user with hand, no relationship with VEID...

True.

But MAC addresses must be unique: this is the only reason for separate VEID.conf files in our setup.

I'd like to be able to write something like this:

```
VETH=" veth${VEID}.0,10.20.30.40.$VEID_LOWBYTE.$VEID_HIBYTE,eth0,10
.20.30.41.$VEID_LOWBYTE.$VEID_HIBYTE "
```
