Yes. 2.6.16.27 is what the current -test is based off of.

I don't *believe* 2.6.16.27 has any exploitable security problems except for SCTP (which, someone correct me if I'm wrong, is not included in the OVZ kernel)

My "shot in the dark" is that it might be a bug between tc and >4GB memory (enterprise kernel). Alternatively, your box might have bad memory (or a bad memory controller...)

From the crashdump it looks like it's dying when you're running the delete-rules.
