Hi,

I'm having problems with using vzpkgcache:

+ /usr/share/vzyum/bin/yum --installroot=/vz/root/100001 --vps=100001 -c /vz/template/centos/4/i386/config/yum.conf -y install ed basesystem coreutils openssh-clients openssh-server bind libstdc++ perl gdbm libgcc readline httpd less lynx wget quota traceroute stunnel slocate rsync unzip vim-minimal man man-pages vixie-cron portmap iptables rpm python crontabs authconfig bzip2 caching-nameserver cpio cups-libs curl cyrus-sasl-plain cyrus-sasl-gssapi diffutils elfutils fetchmail finger finger-server freetype ftp gd gnupg gzip hesiod httpd-manual jwhois libdbi libjpeg libpng libtiff libtool-libs libuser libxslt lsof m4 mailx ncompress netpbm newt ntsysv openldap passwd rootfiles samba-swat samba-client screen setuptool sgml-common sharutils sudo talk talk-server tar tcl tcpdump tcsh telnet time tmpwatch unixODBC utempter xml-common sendmail sendmail-cf sendmail-doc dummy-centos-4 vzdev MAKEDEV -d 5 -e 5
/usr/share/vzpkg/cache-os: line 190: 11038 Floating point exception$YUM $YUM_CMD
+ abort 'yum failed with 136 exit code'
+ log 1 yum failed with 136 exit code

This happens while executing /usr/share/vzpkg/cache-os.

An strace of yum gives me the following: (see attachment).
I'm yusing a Centos 4.4 system and I'm following the instructions on
http://wiki.openvz.org/OS_template_cache_preparation
for 'centos-4' as an os template.
Can you help me?
Thanks in advance!
Regards, Michael
