I did Quote:vzctl set 104 --ipdel 192.168.0.104 --save and that seemed to solve some of the problems, however, there's still a conflict between the eth1 configuration and venet0, as I couldn't contact any hosts outside of the immediate subnet. The solution was to log in to VE 104 and do Quote:ifconfig venet0 down

How do I configure the VE 104 so that I don't have to manually shutdown venet0 each time I restart the server?

Thanks
