Hi vass!!I have checked my entire n/w. There exists no system with the IP addr 192.168.0.10 other than my vps.

I had one doubt, my main hardware node has got two lan cards. One connected to the ISP g/w and the other to the local n/w .i.e 192.168.0.0/24 . I am using a firewall to do the natting .i.e from the local n/w to the inter fc connected to the ISP. Would that be causing a problem?? Moreover service network restart command on the vps shell gives the following o/p.

```
#service network retstart
]# /usr/sbin/vzctl enter 101
entered into VE 101
-bash-3.00# /sbin/service network restart
Shutting down interface venet0:                            [  OK  ]
Shutting down loopback interface:                          [  OK  ]
Disabling IPv4 packet forwarding:                          [  OK  ]
Setting network parameters:  error: unknown error 1 setting key 'kernel.sysrq'
net.ipv4.ip_forward = 1
net.ipv4.conf.default.rp_filter = 1
net.ipv4.conf.default.accept_source_route = 0
error: unknown error 1 setting key 'kernel.core_uses_pid'
                                                           [FAILED]
Bringing up loopback interface:                            [  OK  ]
Bringing up interface venet0:                              [  OK  ]
```

I have checked my /etc/usb_beancounters file. None of the params have been hit. Is that kernel error the one causing the problem. Please help..and Thanks a ton for responding!!!
