Hello,

I'm not satisfied with default Linux kernel behaviour in out of memory situation. I try to change it to smth more appropriate for one of my VEs from inside it and see strange error:

```
[root@my.host:~]$ sysctl -w vm.overcommit_memory=2  
error: unknown error 1 setting key 'vm.overcommit_memory'
```

Any clues who generates this? How to change vm.overcommit_memory for one particular VE?
