Subject: ovz on Slackware

Hello everyone
I'm trying to setup OpenVZ on a Slackware 10.2 HN
So far compiled and modified scripts to use the BSD init scripts (no
/etc/sysconfig) but I get this error:

vzctl start 101
Starting VE ...
VE is mounted
Unable to set capability: Operation not permitted
Unable to set capability
VE start failed
VE is unmounted
#

Can anyone provide me with some insight into possible causes of this error?
What is "vps.mount" and is it not included in the source code tarballs
for a reason?

Thanks
-Stuart
