The way to go here is to replace /sbin/init binary inside a VE with your own script, for example like this:

```
mv /sbin/init /sbin/init.real
cat << EOF > /sbin/init
exec /sbin/init.real > /tmp/init.log 2>&1
EOF
chmod 755 /sbin/init
```

When (re)start a VE and watch its /tmp/init.log file (for example: tail -f /vz/root/NNN/tmp/init.log.
When you have finished your debugging, do not forget to move the real init binary back.
