Hi all:
I'm struggling to setup veth in CT, I just followed the "Simple configuration with virtual Ethernet device" part in http://wiki.openvz.org/Virtual_Ethernet_device
step buy step but it doesn't work for me . I can't ping other machines except CT0, and when I type brctl show it gets nothing, is vmbr0 supposed to be the default bridge??
Another question is how this veth connect to the physical NIC? According to the manual online we needn't to specify which physical NIC to map, so how does OpenVZ know which NIC is mapped to the veth in CT?? Is there any manual in detail about how to setup veth in CT? Thanks very much to reply.I'll appreciate it.

Best Regards
Eugene

That article is very messy, I am not sure what to do, maybe it's better to remove it at all.

Basically, you do not need routing, you need bridging.

I have the same problem. Did you manage to make it work?

I tried to create a bridge network in one of my VE, without success. I followed that tutorial, plus this post: forum.openvz.org/index.php?t=msg&goto=36869&

but some parts are confusing and I am not sure that I'm doing things right. Plus, I don't know what to do with the existing venet interface. Should I delete it?

I hope I find a way soon, because I don't thing it has to be that difficult...
