Subject: Container internet problem

Hi,

For testing purposes I have a CentOS installation in VMWare Fusion, and there I've installed OpenVZ.

Now, after I've created some containers, I have the problem to access the internet from the containers. The hardware node (in my case the CentOS virtual machine) has access to the internet, and also, the HN and the CT can ping each other, so there is a network between them.

I have tried to NAT this setup with IPTables, but no success.

Had someone tried a setup like this successfully? Or has somebody some ideas? Is a setup like this possible?

Thanks in advance.
