Subject: Bad permissions in current Debian6 precreated template

Creating a container with the template "debian-6.0-x86" published on 2012-06-09 from http://wiki.openvz.org/Download/template/precreated the result hasn't setuid flags on files, such as:
/bin/mount
/bin/ping
/bin/ping6
/bin/su
/bin/umount
The result is that with a normal user account cannot use ping nor sudo, for example.

After checking this, I've tried with a previous template for "debian-6.0-x86" (downloaded on April 20th), and everything is right about this matter.

NOTE: I feel that this can be a "bug" subject, but I don't know if Bugzilla still publishes users' email addresses.

I'm also seeing this. E.g. /usr/bin/sudo is missing the suid-bit. I'll file a report about this, this has been ongoing for quite a while.

And there you have it: bugzilla.openvz.org/show_bug.cgi?id=2348
