Hi. I'm using VPS server (openvz) and I want to run openvpn. I install by commands perfectly but when I start the service, FAIL. The error message in the log is relative to tun/tap service.

I use modprobe tun. The result: FATAL: Module tun not found.

I use mkdir /dev/net and mknod /dev/net/tun... with no results

ever module tun not found.

What's wrong?.

my kernel is 2.6.32-042stab053.5

Thanks in advance

have you tried doing like that?  
google -> tun openvz

We are running Proxmox V2.1 OpenVZ containers and successfully using OpenVPN 2.1 within the containers. What is the error that you are receiving?
