Subject: dropping network on container

I am having strange issue.
The HN is a updated Centos 5.9 with 20+ VEs running without any issues for years.
Recently I have add an VE from template centos-6-x86-devel and the only issue I am experiencing that the container is loosing network/interface.
It has no pattern, like every 4 hours. When it does happen :
the ifconfig command is stock showing only lo, no ping of any host is available and venet0, venet0:0 are not showing nor responding.
restarting network service also gets stock
I attempted to follow this post:
forum.proxmox.com/threads/8301-OpenVZ-Containers-lose-intern
et-connection-%28VLAN-venet%29
but it did not help.

Some times the network will drop for only fief seconds, and sometimes permanently.
The logs do not show anything on VE nor on HN.
