Is it possible to have a VE working with 2 differents subnet ip address?

I have a HN with 2 interfaces, one with an public ip and another with private ip.

I have several VEs running on it, some with private ips and some with public ips. All work well but, if I try to use one public and one private on same VE, the secondary IP (no matter what) will not work outside the HN.

Explanation.

If [IP_ADDRESS="84.232.xxx.xxx 172.20.20.252"] all will work ok with the public ip, but private will only ping to 172.20.20.253 (HN Private IP)

If I swich it, [IP_ADDRESS="172.20.20.252 84.232.xxx.xxx"], all will work ok with the private ip, but the public will only have comm with the HN.

Any tip on this? I tried setting NEIGHBOUR_DEVS=detect in vz.conf to all, but then all networking stop working.

Thanks in advance

Seems a lot of people (including me) are having this issue, and there is no one that has responded to any of the posts I have come across.
