I try to bridge the physical interface in the CT0 to the virtual ethernet device. I just fllowed the guide,
I creat a virtual container named CT101, it has a virtual ethernet device veth101.0, and the corresponding network interface in CT101 is eth0. I found that the network interface in CT101 can just receive broadcast packages and can not receive icmp packages.
why ?? and how to bridge the physical interface to the virtual ethernet device ?? thanks!
