Ive have a dell power edge sc1425 with 8GB ram, 1TB hard drive and a 60 gb SSD.
i have formatted the 1tb hard drive to /vz and the 60gb SSD to a /boot, /, and a swap drive. when I install openvz i then rebooted then installed openvz webpanel from googlecode when i created a Virtual machine it gave me this error:

```
Internal error: Command 'vzctl create 1 --ostemplate centos-6-x86_64 --config vswap-256m'
execution failed with code 151
Output: Creating image: /vz/private/1.tmp/root.hdd/root.hdd size=2306867K
Creating delta /vz/private/1.tmp/root.hdd/root.hdd bs=2048 size=4614144 sectors v1
Storing /vz/private/1.tmp/root.hdd/DiskDescriptor.xml
Opening delta /vz/private/1.tmp/root.hdd/root.hdd
Adding delta dev=/dev/ploop42565 img=/vz/private/1.tmp/root.hdd/root.hdd (rw)
Error: Input/output error during read on /dev/ploop42565
Error in run_prg_rc (util.c:289): Command parted -s /dev/ploop42565 mklabel gpt mkpart primary

Hi,
don't use ct id 1, it is recommended to use id from 100.
please report distribution, kernel, vzctl and ploop versions.
what filesystem is in /vz?
can you test with command line vzctl?

Distribution : centos 6.4
Kernel 2.6.32-042stab083.2 on an x86_64
the vzctl version: vzctl-core-4.6.1-1.x86_64
vzctl-4.6.1-1.x86_64

i don't know what the ploot version is.
the file system for the /vz is ext4
my server console is now showing a strange error it doesn't seem to effect anything though. I've added an image to the post.

looking to screenshot I would recommend to check your hard disks and cables. maybe other hardware problems.
