Hello,

got this error when tried to execute some command on my vps from host node (vzctl exec 190 w)

Quote:Warning: Unknown iptable module: fuse, skipped

Unable to fork: Cannot allocate memory

mainly i would like to ask how the module should be named.. i dont remember i added fuse there, but i recently used "sshfs" linux tool which is designed to use fuse to mount folder of my openvz vps (right this erroneous one) to my desktop pc..

it failed several times, but also succeeded to work. but from now on i was unable to mount remote directory of my server and above error appeared.

Anyone have idea how to solve, prevent happen? Why actually "fuse" is unknown?

PS: can be "Unable to fork .. memory" dealt other way than restarting vps / like resetting, flushing..memory in software way?
